Solicitation of Public Review and  
Comment of research protocol. A multicenter  
Randomized Dose Response Study of the Safety  
Clinical and Immune Response.

To whom it may concern,

I am writing to you today in regards to the Dryvax Administered to Children 2 to 5 years of age. I have many concerns with the smallpox vaccination that I believe could be counted for when immunized.

One concern in which I came in contact with when dealing with the population was that if children ages 2 - 5 are out of school / daycare for one month who would take care of these children? How are they going to learn?

OZN-0466

C37

Another concern which crosses my mind is the fact that out of the 260 million Americans, 15 out of each 1 million citizens

will have a life threatening illness and  
one or two of those million will die. How  
are we going to keep this nation  
safe, when our own American people  
are dying from this vaccination?

In closing I believe that the  
small pox vaccination will not be  
a good idea. We need to worry  
about the United States of America  
instead of waring about bio terrorist  
ATTACKS.

Sincerely,  
Private Name
